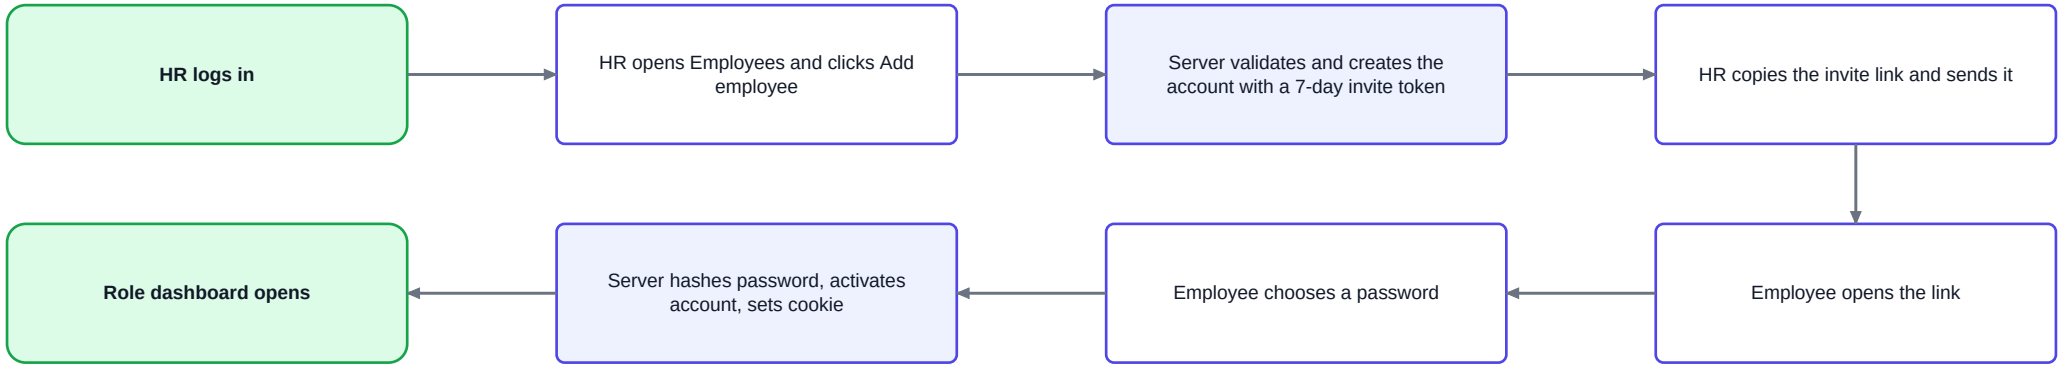
User Flow

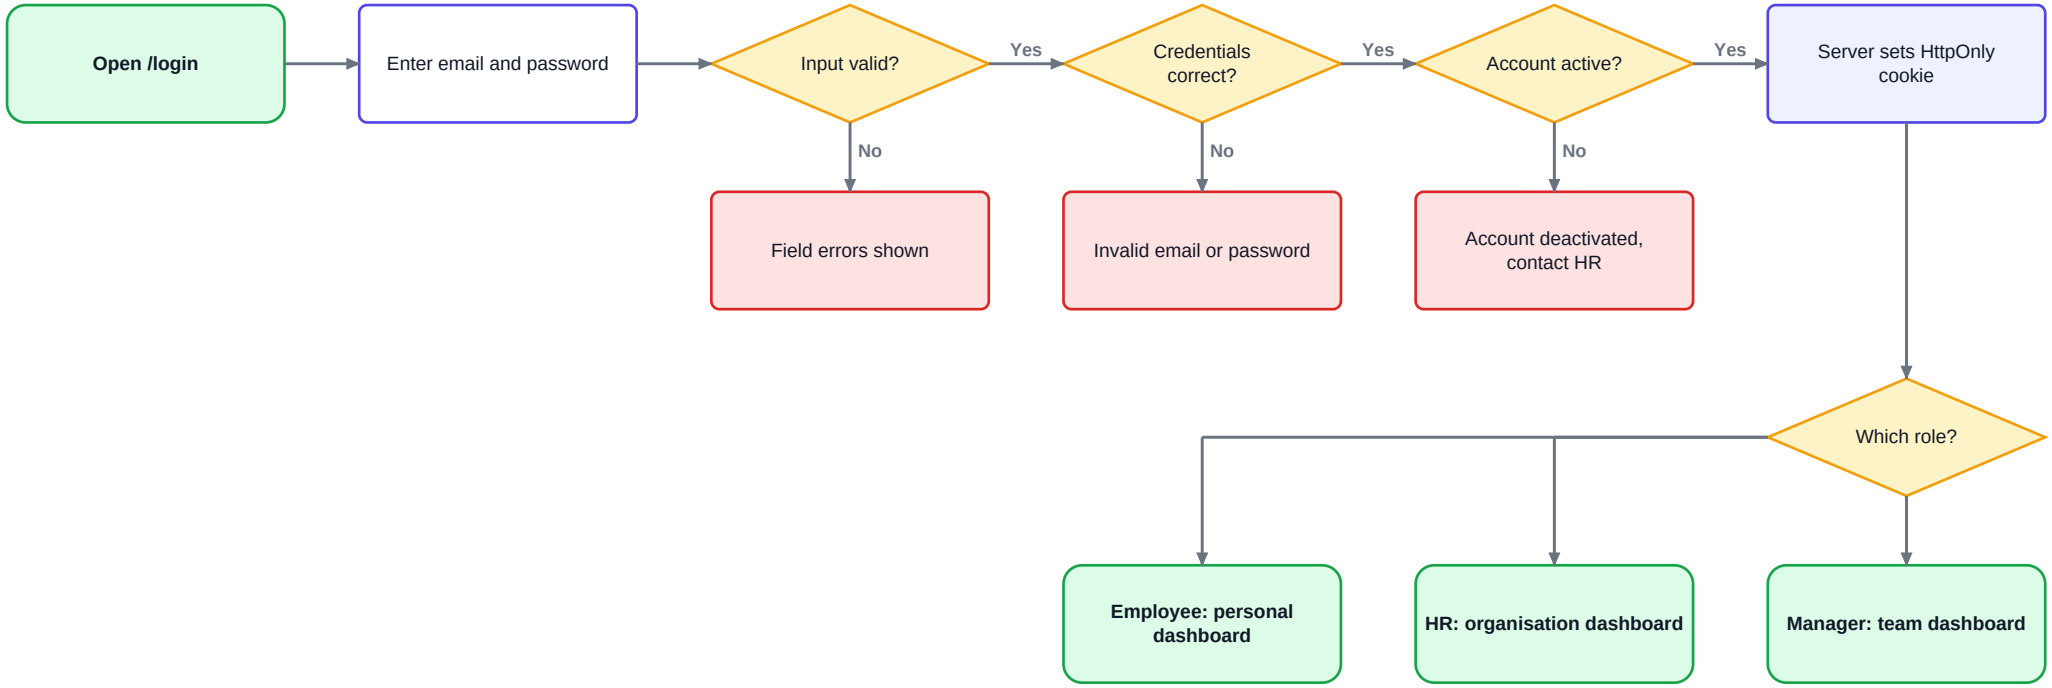
Step-by-step journeys through StaffSync. Green = start or end, white = user action, blue = automatic server action, amber = decision, red = refused.

Flow 1: Creating an account and first sign-in (invitation)



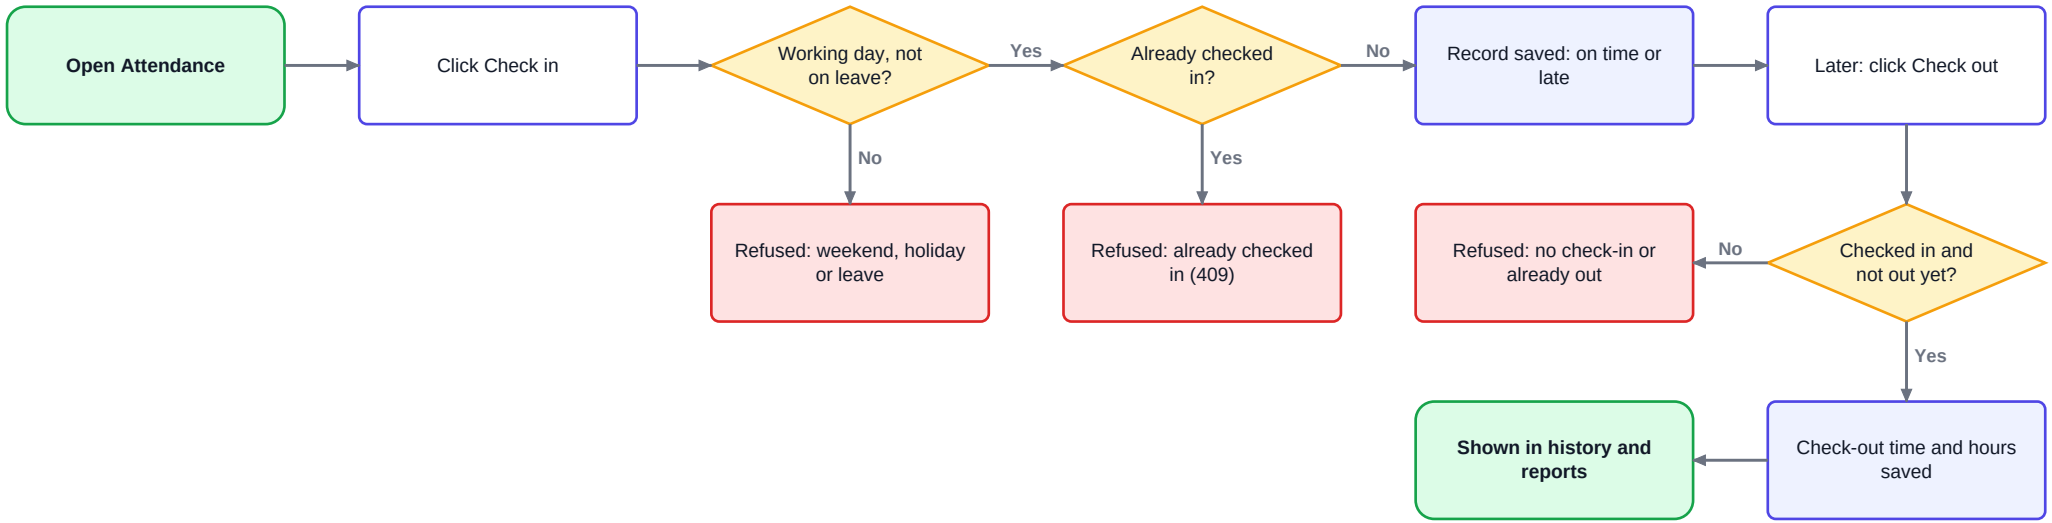
- Only HR can create accounts; there is no public registration. The very first HR account is created once on the Setup page with the SETUP_KEY.
- The link works once and expires after 7 days. HR can generate a new link for anyone who has not activated yet.

Flow 2: Login and role-based access



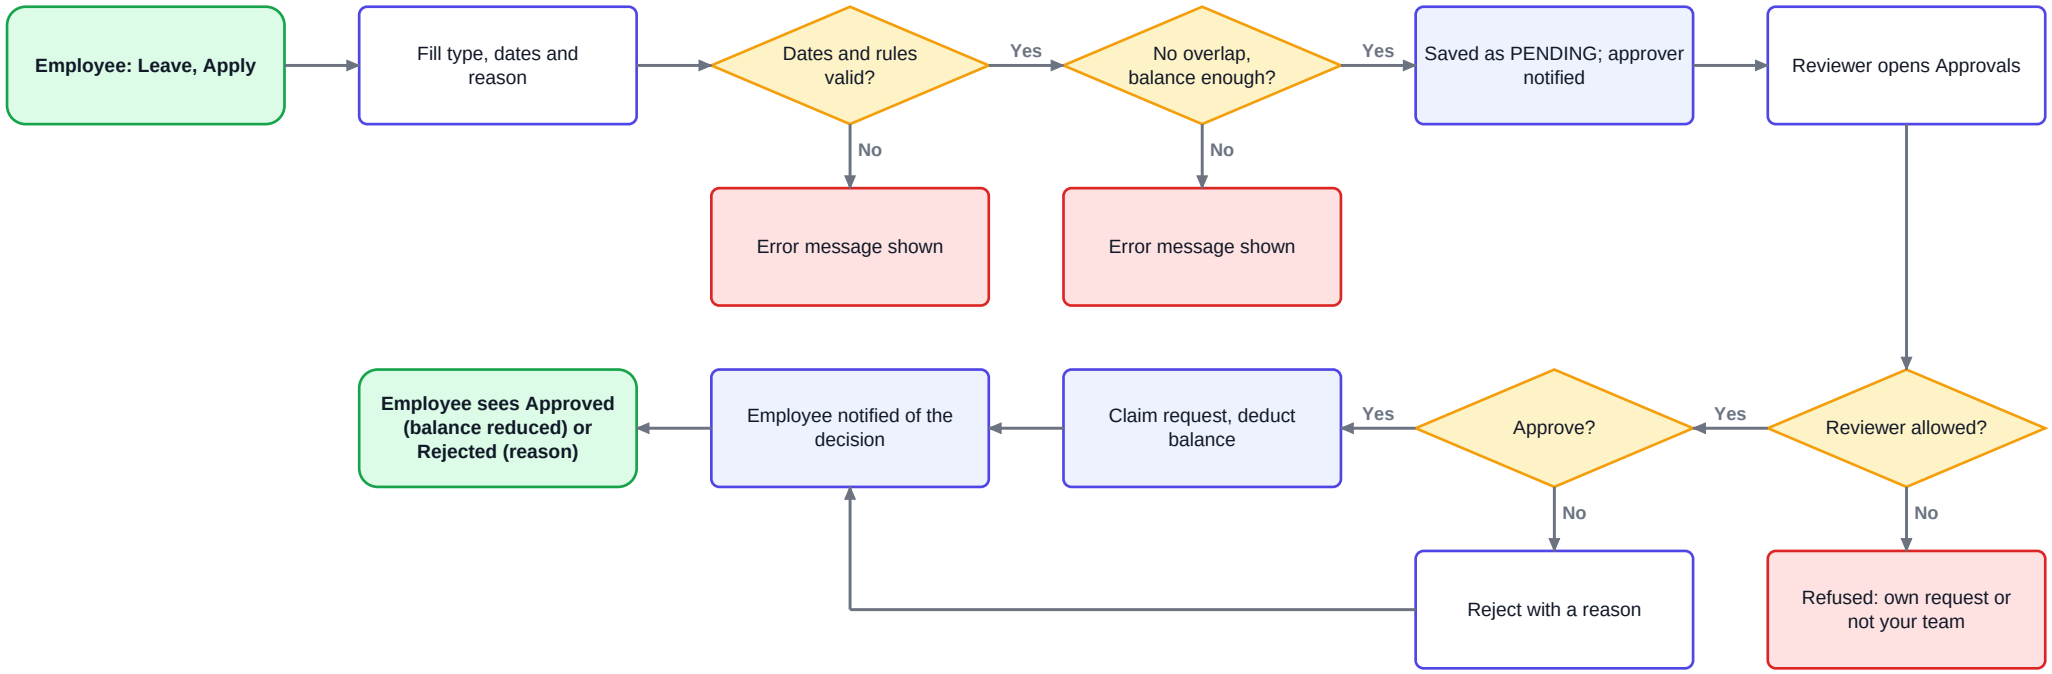
- After login the browser sends the cookie automatically. On every request the server verifies it, reloads the user and checks the role. If the session expires or a password changes, the next request returns 401 and the app returns to the login page.
- Trying to open a page your role cannot use (for example Departments as a manager) shows the Access denied page; the API would refuse the data anyway.

Flow 3: Daily attendance



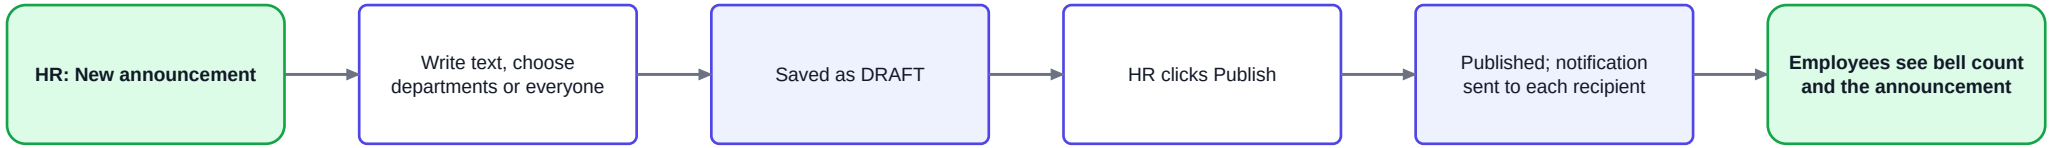
- Late means after work start (09:30) plus the grace period (15 minutes) in the organisation timezone; both are configurable.
- The database allows only one record per person per day, so a double click or two devices cannot create duplicates.
- A past day with a check-in but no check-out is shown as Missed check-out; it is not auto-corrected.

Flow 4: Leave request, approval and balance

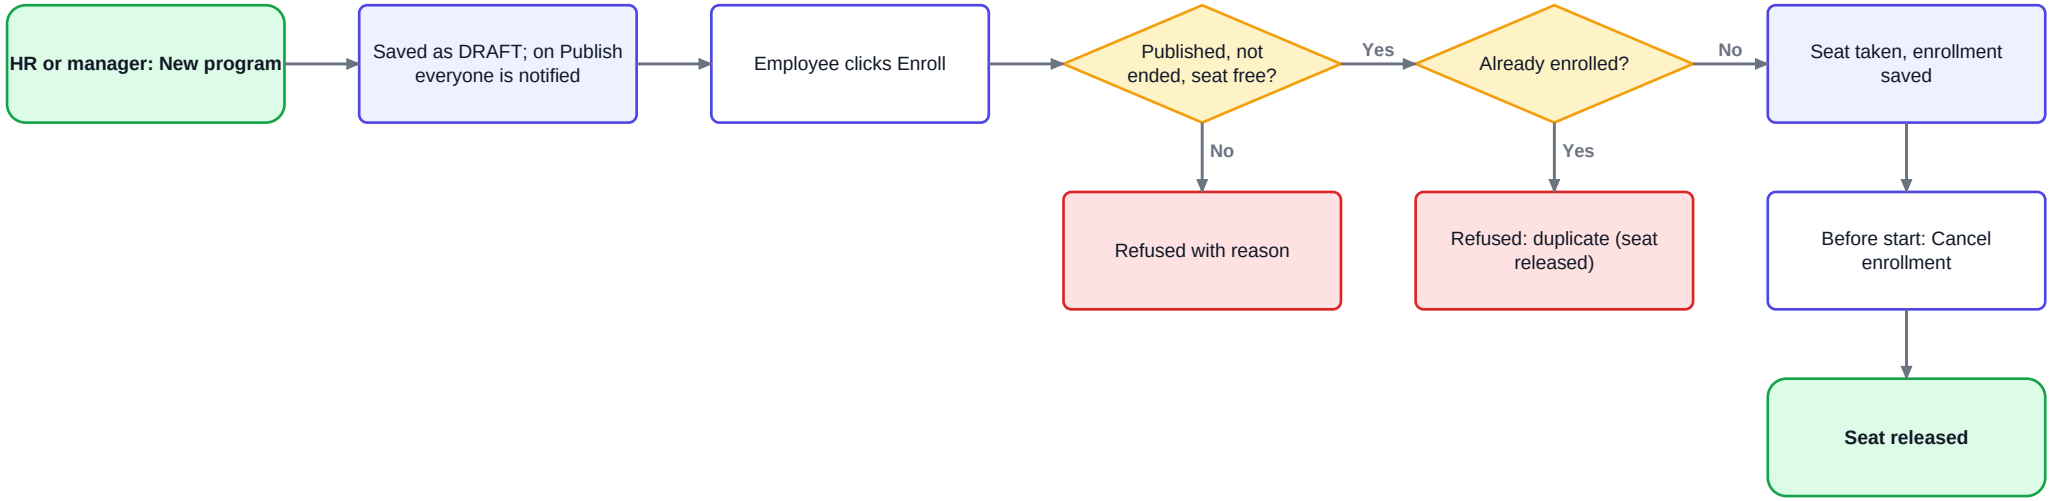


- **Approve** first claims the pending request with one atomic update (so two reviewers cannot both approve), then deducts days only if the balance still covers them; if not, the claim is undone and the reviewer sees an error.
- **Cancel:** the employee can cancel a pending request, or an approved one that has not started. Approved days go back to the balance.
- **Who reviews:** HR any request except their own; a manager only direct reports; nobody reviews their own leave.

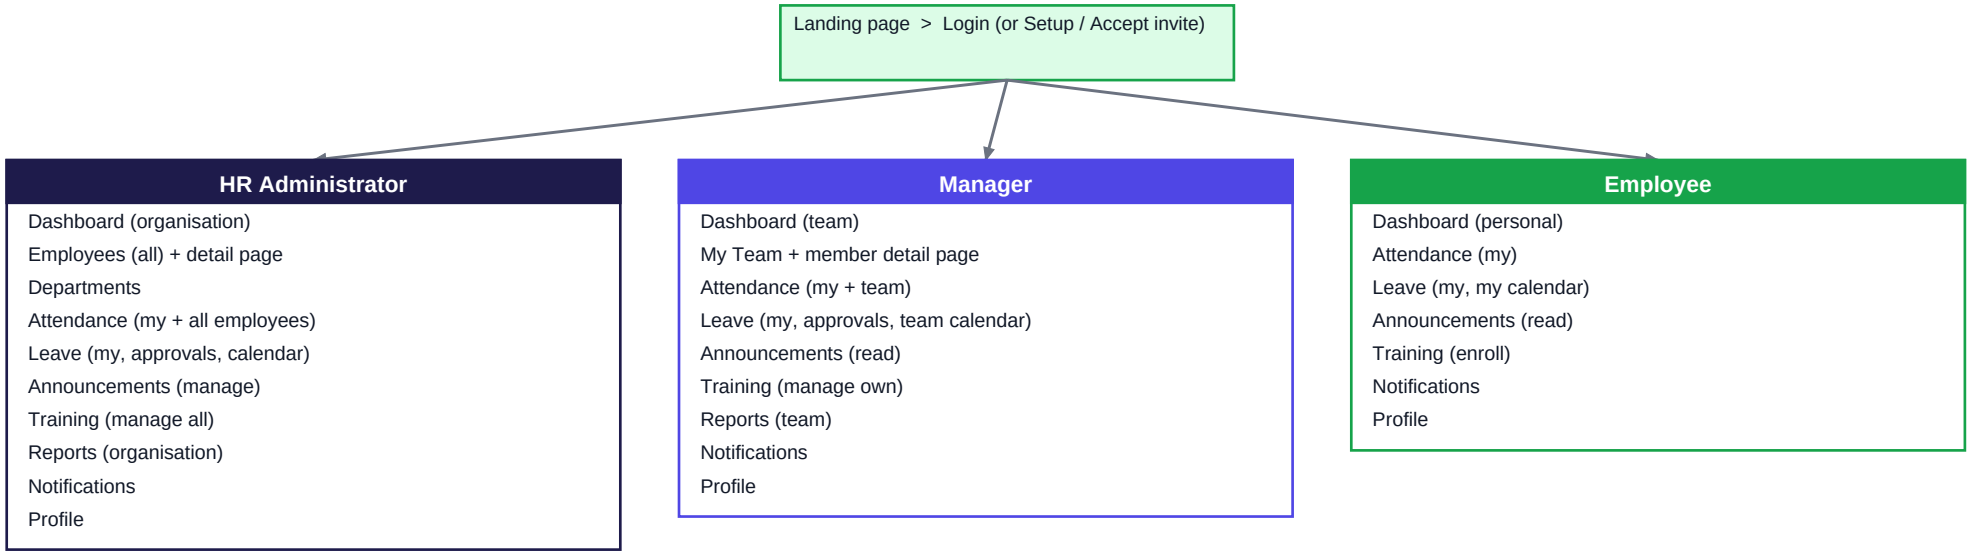
Flow 5a: Announcements



Flow 5b: Training program and enrollment



Flow 6: Navigation map by role



- All roles share Attendance, Leave, Announcements, Training, Notifications and Profile; what each role sees inside those pages depends on scope (own, team or organisation).
- The sidebar shows only menu items the current role can use. The server checks every request as well.
